ROBLOX DEVELOPER ARCHIVES: RESEARCH RECORD DE-01
THE DEVEX CONVERSION DISPARITY & ECONOMIC PIPELINE CORROSION
Documented by: Hamgram77

==========

---
1. EXECUTIVE SUMMARY

This research record details the widening structural and mathematical chasm between the real-world value of consumer capital entering the Roblox ecosystem and the eventual net payout delivered to independent creators via the Developer Exchange (DevEx) system. By investigating the compounding platform fees, hidden transactional taxes, and strict internal holding regulations, this document exposes how the platform's economics disproportionately burden solo and independent development teams.

---
2. THE THREE-TIER COMPOUNDING PLATFORM CUT

The public marketing for Roblox implies a standard marketplace fee, but the actual technical backend routes every transaction through a three-tier value-reduction pipeline. By the time a player's real-world dollar is converted into cash in a developer's bank account, Roblox retains a staggering 75.5% of the total economic value.

* Tier 1: The Initial Purchase Friction (App Store / Payment Processing)
  When a user purchases Robux through mobile devices (iOS/Android), the respective application stores extract a non-negotiable 30% processing fee. While this is an industry standard for mobile storefronts, Roblox applies this extraction against the baseline pool of capital before calculating the developer's portion, forcing the creator to absorb the cost of platform payment processing.

* Tier 2: The In-Game Marketplace Tax (The 30% / 70% Illusion)
  When an asset, game pass, or developer product is sold inside an experience, Roblox automatically levies a baseline 30% "Marketplace Tax" on the transaction. If the item is a user-generated clothing asset or utilizes a third-party affiliate link, this platform fee spikes up to 70%, leaving the actual creator with as little as 30% of the nominal Robux value spent by the consumer.

* Tier 3: The DevEx Devaluation Ratio (The Real-World Exchange Sink)

The final and most aggressive financial reduction occurs at the point of cash-out. Roblox intentionally devalues the currency when converting it back into real fiat currency.
- Consumer Purchase Rate: Approx. $0.0125 USD per 1 Robux.
- Developer DevEx Rate: Exactly $0.0035 USD per 1 Robux.
This means the platform forces a massive 72% devaluation on the token value itself during the conversion process.

---
3. THE "EARNED ROBUX" VERIFICATION TRAP

Even if a developer achieves the minimum threshold of 30,000 Robux required to submit a DevEx application, the automated system utilizes a strict, non-transparent vetting algorithm to isolate what it deems "Earned Robux."

* The Holding State Loophole:
Robux acquired via trading, limited marketplace flipping, group fund payouts without direct game-pass lineage, or developer-to-developer transfers are routinely flagged as "Non-Earned." The system places these funds into indefinite holding states, preventing developers from utilizing their accumulated internal capital to pay external team members, voice actors, or UI designers.

* The DevEx Seizure Vulnerability:
Because the DevEx program is structured as a voluntary corporate benefit rather than a legally protected wage framework, Roblox reserves the absolute right to deny any DevEx application for generic account infractions. If an independent creator receives a single false automated asset warning within the evaluation period, the system can permanently freeze the DevEx portal, seizing thousands of dollars of real-world value without legal recourse.
